

(a) accuracy at train_40k

(b) capacity-matched and unmatched contrasts

Bars are image-clustered 95% intervals on 7,714 development questions over 768 represented images, five training seeds. The accuracy axis does not start at zero: the systems differ by a few accuracy points and a zero-based axis would make the intervals illegible.

Trainable parameters: concat 576,100, fusion 1,100,388. Only the matched pairs isolate the feature effect. Intervals are image-clustered and uncorrected for multiplicity; an interval containing zero is an absence of a detected effect, never equivalence.
