

V2-era closed-vocabulary scorer (50 rows)

pinned G21 normalised scorer (16 rows)

Each open marker is one independent training seed and the tick is the across-seed mean; no summary bar hides the spread. The spread here is across independent TRAINING seeds. It is a different metric for V2, E2 and E3 and three for V3, E8A, E8B and E10, and are never pooled across families. The two metrics are drawn as separate blocks and never share a scale. Checkpoint selection also differs: V2, V3, E2, E3 and E8A select the best development epoch while E8B and E10 use the frozen fixed-22 rule, so the dispersions are not measured under one selection protocol.
