

Image-clustered 95% intervals on 9,823 top-1000-view development questions over 776 represented images, five training seeds. Top-100 and top-1000 results are NEVER paired: they use different development rows, a different class count and different training rows, so no accuracy is differenced across the two blocks. Class competition and the smaller head-answer share of a fixed budget are confounded in any head-row comparison.
