

(a) per-slice accuracy at train_40k

(b) fusion minus concat by slice, five-seed convention

Slices are unequal and dependent; every interval is clustered on that slice's own represented development images and is uncorrected for multiplicity. With fourteen slices, some intervals excluding zero by chance is expected, which is why per-slice findings are secondary. The v2_05b row-level normal-approximation intervals are superseded by these clustered intervals and are never re-quoted. The source stores both a five-seed and a seed-42 convention: only the five-seed convention is plotted here, and the seed-42 rows are tabulated in full in VE1-TAB-A1.
