

(a) accuracy by program length, train_40k — claim-driving systems

Buckets are unequal and dependent; every interval is image-clustered on that bucket's own represented development images. Program length is a proxy for reasoning depth, not a measure of reasoning performed.

(b) pooled deficit against fixed v2_05b per-bucket priors

The deficit describes one system's own step profile against fixed v2_05b per-bucket priors. It is not a contrast between systems and establishes no cause. Intervals are image-clustered and uncorrected for multiplicity.
